Version 2.2.4 - June 2009  
Fixed Bugs

- Some small bugs have been fixed. Those bugs were related to the traffic management and also to the control of a real layout (speed setting and keyboard control).

### Improvements

- A new train, the "TGV" or "ICE", has been introduced, following the design done by René, adapted to the limitations of CATrain concerning the drawing and color choice...! (see the layout "René 4 tgv.tci" included in the examples).
- The locos are now present inside the "wagon" dialog box to be able to create double traction trains.
